

Analyzing neural time series data: Theory and practice

Mike X Cohen

MIT Press, early 2014

Contents

Section 1: Introductions

Chapter 1: The purpose of this book, who should read it, and how to use it

- 1.1 What is cognitive electrophysiology?
- 1.2 What is the purpose of this book?
- 1.3 Why shouldn't you use <insert name of M/EEG software analysis package>?
- 1.4 Why program analyses, and why in Matlab?
- 1.5 How best to learn from and use the book
- 1.6 Sample data and online code
- 1.7 Terminology used in this book
- 1.8 Exercises
- 1.9 Is everything there is to know about EEG analyses in this book?
- 1.10 Who should read this book?
- 1.11 Is this book difficult?
- 1.12 Questions?

Chapter 2: Advantages and limitations of time- and time-frequency-domain analyses

- 2.1 Why EEG?
- 2.2 Why not EEG?
- 2.3 Interpreting voltage values from the EEG signal
- 2.4 Advantages of event-related potentials (ERPs)
- 2.5 Limitations of ERPs
- 2.6 Advantages of time-frequency-based approaches
- 2.7 Limitations of time-frequency-based approaches
- 2.8 Temporal resolution, precision, and accuracy of EEG
- 2.9 Spatial resolution, precision, and accuracy of EEG
- 2.10 Topographical localization vs. brain localization
- 2.11 EEG or MEG?
- 2.12 Costs of EEG research

Chapter 3: Interpreting and asking questions about time-frequency results

- 3.1 EEG time-frequency: The basics
- 3.2 Ways to view time-frequency results
- 3.3 tfviewerx and erpviewerx
- 3.4 How to view and interpret time-frequency results
- 3.5 Things to be suspicious of when viewing time-frequency results
- 3.6 Do results in time-frequency plots mean that there were neural oscillations?

Chapter 4: Introduction to Matlab programming

- 4.1 Write clean and efficient code
- 4.2 Use meaningful file and variable names
- 4.3 Make regular backups of your code, and keep original copies of modified code
- 4.4 Initialize variables

- 4.5 Help!
- 4.6 Be patient and embrace the learning experience
- 4.7 Exercises

Chapter 5: Introduction to the physiological bases of EEG

- 5.1 Biophysical events that are measurable with EEG
- 5.2 Neurobiological mechanisms of oscillations
- 5.3 Phase-locked, time-locked, task-related
- 5.4 Neurophysiological mechanisms of ERPs
- 5.5 Are electrical fields causally involved in cognition?
- 5.6 What if electrical fields are not causally involved in cognition?

Chapter 6: Practicalities of EEG measurement and experimental design

- 6.1 Designing experiments: discuss, pilot, discuss, pilot
- 6.2 Event markers
- 6.3 Intra- and inter-trial timing
- 6.4 How many trials you will need
- 6.5 How many electrodes you will need
- 6.6 Which sampling rate to use when recording data
- 6.7 Other optional equipment to consider

Section 2: Pre-processing and time-domain analyses

Chapter 7: Preprocessing steps necessary and useful for advanced data analysis

- 7.1 What is preprocessing?
- 7.2 The balance between signal and noise
- 7.3 Creating epochs
- 7.4 Matching trial count across conditions
- 7.5 Filtering
- 7.6 Trial rejection
- 7.7 Spatial filtering
- 7.8 Referencing
- 7.9 Interpolating bad electrodes
- 7.10 Start with clean data

Chapter 8: EEG artifacts: their detection, influence, and removal

- 8.1 Removing data based on independent components analysis
- 8.2 Removing trials because of blinks
- 8.3 Removing trials because of oculomotor activity
- 8.4 Removing trials based on EMG in EEG channels
- 8.5 Removing trials based on response hand EMG
- 8.6 Removing trials based on task performance
- 8.7 Train subjects to minimize artifacts
- 8.8 Minimize artifacts during data collection

Chapter 9: Overview of time-domain EEG analyses

- 9.1 Event-related potentials
- 9.2 Filtering ERPs
- 9.3 Butterfly plots and global field power/topographical variance plots
- 9.4 The flicker effect
- 9.5 Topographical maps
- 9.6 Microstates
- 9.7 ERP images
- 9.8 Exercises

Section 3: Frequency and time-frequency domains analyses

Chapter 10: The dot product and convolution

- 10.1 Dot product
- 10.2 Convolution
- 10.3 How does convolution work?
- 10.4 Convolution vs. cross-covariance
- 10.5 The purpose of convolution for EEG data analyses
- 10.6 Exercises

Chapter 11: The discrete time Fourier transform, the FFT, and the convolution theorem

- 11.1 Making waves
- 11.2 Finding waves in EEG data with the Fourier transform
- 11.3 The discrete time Fourier transform
- 11.4 Visualizing the results of a Fourier transform
- 11.5 Complex results and negative frequencies
- 11.6 Inverse Fourier transform
- 11.7 The Fast-Fourier-Transform
- 11.8 Stationarity and the Fourier transform
- 11.9 Extracting more or fewer frequencies than data points
- 11.10 The convolution theorem
- 11.11 Performing FFT-based convolution in Matlab
- 11.12 Exercises

Chapter 12: Morlet wavelets and wavelet convolution

- 12.1 Why wavelets?
- 12.2 How to make wavelets
- 12.3 Wavelet convolution as a band-pass filter
- 12.4 Limitations of wavelet convolution as discussed thus far
- 12.5 Exercises

Chapter 13: Complex wavelets and extracting power and phase

- 13.1 The wavelet complex
- 13.2 Imagining the imaginary
- 13.3 Rectangular and polar notation, and the complex plane

- 13.4 Euler's formula
- 13.5 Euler's formula and the result of complex wavelet convolution
- 13.6 From time point to time series
- 13.7 Parameters of wavelets and recommended settings
- 13.8 Determining the frequency smoothing of wavelets
- 13.9 Tips for writing efficient convolution code in Matlab
- 13.10 Describing this analysis in your Methods section
- 13.11 Exercises

Chapter 14: Band-pass filtering and the Hilbert transform

- 14.1 Hilbert transform
- 14.2 Filtering data before applying the Hilbert transform
- 14.3 Finite vs. infinite impulse response filters
- 14.4 Band-pass, band-stop, high-pass, low-pass
- 14.5 Constructing a filter
- 14.6 Check your filters
- 14.7 Applying the filter to data
- 14.8 Butterworth (IIR) filter
- 14.9 Filtering each trial vs. filtering concatenated trials
- 14.10 Multiple frequencies
- 14.11 A world of filters
- 14.12 Describing this analysis in your Methods section
- 14.13 Exercises

Chapter 15: Short-time FFT

- 15.1 How the short-time FFT works
- 15.2 Taper the time series
- 15.3 Time segment lengths and overlap
- 15.4 Power and phase
- 15.5 Describing this analysis in your Methods section
- 15.6 Exercises

Chapter 16: Multi-taper

- 16.1 How the multitaper method works
- 16.2 The tapers
- 16.3 When you should and should not use multitapers
- 16.4 The Multitaper framework and advanced topics
- 16.5 Describing this analysis in your Methods section
- 16.6 Exercises

Chapter 17: Less commonly used time-frequency decomposition methods

- 17.1 Autoregressive modeling
- 17.2 Hilbert-Huang
- 17.3 Matching pursuit

- 17.4 P-episode
- 17.6 S-transform

Chapter 18: Time-frequency power, and baseline corrections

- 18.1 1/f power scaling
- 18.2 The solution to 1/f power in task designs
- 18.3 Decibel conversion
- 18.4 Percent change and baseline division
- 18.5 Z-transform
- 18.6 Not all transforms are equal
- 18.7 Other transforms
- 18.8 Mean vs. median
- 18.9 Single-trial baseline normalization
- 18.10 The choice of baseline time window
- 18.11 Disadvantages of baseline-normalized power
- 18.12 Signal-to-noise estimates
- 18.13 Number of trials and power estimates
- 18.14 Down-sampling results after analyses
- 18.15 Describing this analysis in your Methods section
- 18.16 Exercises

Chapter 19: Inter-trial phase clustering

- 19.1 Why phase values cannot be averaged
- 19.2 Inter-trial phase clustering
- 19.3 Strength in numbers
- 19.4 Using ITPC when there are few trials or condition differences in trial count
- 19.5 Effects of temporal jitter on ITPC and power
- 19.6 ITPC and power
- 19.7 Weighted ITPC
- 19.8 Multimodal phase distributions
- 19.9 Spike-field coherence
- 19.10 Describing this analysis in your Methods section
- 19.11 Exercises

Chapter 20: Differences among total, phase-locked, and non-phase locked power, and phase clustering

- 20.1 Total power
- 20.2 Non-phase-locked power
- 20.3 Phase-locked power
- 20.4 Inter-trial phase clustering
- 20.5 When to use what approach
- 20.6 Exercises

Chapter 21: Interpretations and limitations of time-frequency power and phase analyses

- 21.1 Terminology
- 21.2 When to use what time-frequency decomposition method
- 21.3 Interpreting time-frequency power
- 21.4 Interpreting time-frequency inter-trial phase clustering
- 21.5 Limitations of time-frequency power and inter-trial phase clustering
- 21.6 Do time-frequency analyses reveal neural oscillations?

Section 4: Spatial filters

Chapter 22: Surface Laplacian

- 22.1 What is the surface Laplacian?
- 22.2 Algorithms for computing the surface Laplacian for EEG data
- 22.3 Surface Laplacian for topographical localization
- 22.4 Surface Laplacian for connectivity analyses
- 22.5 Surface Laplacian for cleaning topographical noise
- 22.6 Describing this analysis in your Methods section
- 22.7 Exercises

Chapter 23: Principal components analysis

- 23.1 Purpose and interpretations of PCA
- 23.2 How PCA is computed
- 23.3 Distinguishing significant from non-significant components
- 23.4 Rotating PCA solutions
- 23.5 Time-resolved PCA
- 23.6 PCA with time-frequency information
- 23.7 PCA across conditions
- 23.8 Independent components analysis (ICA)
- 23.9 Describing this method in your methods section
- 23.10 Exercises

Chapter 24: Basics of single dipole and distributed source imaging

- 24.1 The forward solution
- 24.2 The inverse problem
- 24.3 Dipole fitting
- 24.4 Non-adaptive distributed source imaging methods

Section 5: Connectivity

Chapter 25: Introduction to the various connectivity analyses

- 25.1 Why only two sites (bivariate connectivity)?
- 25.2 Important concepts related to bivariate connectivity
- 25.3 Which measure of connectivity should be used?
- 25.4 Phase-based connectivity
- 25.5 Power-based connectivity
- 25.6 Granger prediction
- 25.7 Mutual information

- 25.8 Cross-frequency coupling
- 25.9 Graph theory
- 25.10 Potential confound of volume conduction

Chapter 26: Phase-based connectivity

- 26.1 Terminology
- 26.2 Inter-site phase clustering (ISPC) over time
- 26.3 ISPC-trials
- 26.4 ISPC and the number of trials
- 26.5 Relation between ISPC and power
- 26.6 Weighted ISPC-trials
- 26.7 Spectral coherence (a.k.a. magnitude squared coherence)
- 26.8 Imaginary coherence, phase lag index, and weighted phase lag index
- 26.9 Which measure of phase connectivity should you use?
- 26.10 Testing the mean phase angle
- 26.11 Describing these analyses in your Methods section
- 26.12 Exercises

Chapter 27: Power-based connectivity

- 27.1 Spearman vs. Pearson coefficient for power correlations
- 27.2 Power correlations over time
- 27.3 Power correlations over trials
- 27.4 Partial correlations
- 27.5 Matlab programming tips
- 27.6 Describing this analysis in your Methods section
- 27.7 Exercises

Chapter 28: Granger prediction

- 28.1 Univariate autoregression
- 28.2 Bivariate autoregression
- 28.3 Autoregression errors and error variances
- 28.4 Granger prediction over time
- 28.5 Model order
- 28.6 Frequency domain Granger prediction
- 28.7 Time series covariance stationarity
- 28.8 Baseline normalization of Granger prediction results
- 28.9 Statistics
- 28.10 Additional applications of Granger prediction
- 28.11 Exercises

Chapter 29: Mutual information

- 29.1 Entropy
- 29.2 How many histogram bins to use
- 29.3 Enjoy the entropy

- 29.4 Joint entropy
- 29.5 Mutual information
- 29.6 Mutual information and amount of data
- 29.7 Mutual information with noisy data
- 29.8 Mutual information over time or over trials
- 29.9 Mutual information on real data
- 29.10 Mutual information on frequency band-specific data
- 29.11 Lagged mutual information
- 29.12 Statistics
- 29.13 More information
- 29.14 Describing this analysis in your Methods section
- 29.15 Exercises

Chapter 30: Cross-frequency coupling

- 30.1 Visual inspection of cross-frequency coupling
- 30.2 Power-power correlations
- 30.3 A priori phase-amplitude coupling
- 30.4 Separating task-related phase and power co-activations from phase-amplitude coupling
- 30.5 Mixed a priori/exploratory phase-amplitude coupling
- 30.6 Exploratory phase-amplitude coupling
- 30.7 Notes about phase-amplitude coupling
- 30.8 Phase-phase coupling
- 30.9 Other methods for quantifying cross-frequency coupling
- 30.10 Cross-frequency coupling over time or over trials
- 30.11 Describing this analysis in your Methods section
- 30.12 Exercises

Chapter 31: Graph theory

- 31.1 Networks as matrices and graphs
- 31.2 Thresholding connectivity matrices
- 31.3 Connectivity degree
- 31.3 Clustering coefficient
- 31.4 Path length
- 31.5 Small-world networks
- 31.6 Statistics
- 31.7 How to describe these analyses in your paper
- 31.8 Exercises

Section 6: Statistical analyses

Chapter 32: Advantages and limitations of different statistical procedures

- 32.1 Are statistics necessary?
- 32.2 At what level should statistics be performed?
- 32.3 What p-value (or other significance threshold) should be used, and should multiple comparisons corrections be applied?

- 32.4 Are p-values the only statistical metric?
- 32.5 Statistical significance vs. practical significance
- 32.6 Type I and Type II errors
- 32.7 What kinds of statistics (e.g., parametric, non-parametric, Bayesian) should be applied?
- 32.8 How to combine data across subjects

Chapter 33: Non-parametric permutation testing

- 33.1 Advantages of non-parametric permutation testing
- 33.2 Creating a null hypothesis distribution
- 33.3 How many iterations are necessary for the null hypothesis distribution?
- 33.4 Determining statistical significance
- 33.5 Multiple comparisons and their corrections
- 33.6 Correction for multiple comparisons at the pixel level
- 33.7 Corrections for multiple comparisons at the cluster level
- 33.8 False discovery rate (FDR) for multiple comparisons correction
- 33.9 What should be permuted?
- 33.10 Non-parametric permutation testing beyond simple bivariate cases
- 33.11 Describing this analysis in your Methods section

Chapter 34: Within-subject statistical analyses

- 34.1 Changes in task-related power compared to baseline
- 34.2 Discrete condition differences in power
- 34.3 Continuous relationship with power: single-trial correlations
- 34.4 Continuous relationships with power: single-trial multiple regression
- 34.5 Determining statistical significance of phase-based data (ITPC and ISPC)
- 34.6 Testing preferred phase angle across conditions
- 34.7 Testing the statistical significance of correlation coefficients

Chapter 35: Group-level analyses and appropriate data analysis strategies

- 35.1 Avoid circular inferences
- 35.2 Group-level analysis strategy 1: Test each pixel and apply a map-wise threshold
- 35.3 Group-level analysis strategy 2a: Time-frequency windows for hypothesis-driven analyses
- 35.4 Group-level analysis strategy 2b: Subject-specific time-frequency windows for hypothesis-driven analyses
- 35.5 Determining how many subjects you need for group-level analyses

Chapter 36: Recommendations for reporting results in figures, tables, and text

- 36.1 Recommendation 1: One figure, one idea
- 36.2 Recommendation 2: Show data
- 36.3 Recommendation 3: Highlight significant effects instead of removing non-significant effects
- 36.4 Recommendation 4: Show specificity (or lack thereof) in frequency, time, and space
- 36.5 Recommendation 5: Use color
- 36.6 Recommendation 6: Use informative figure labels and captions

- 36.7 Recommendation 7: Avoid showing “representative” data
- 36.8 A check-list for making figures
- 36.9 Tables
- 36.10 Reporting results in the Results section

Section 7: Conclusions and future directions

Chapter 37: Recurring themes in this book, and some personal advice

- 37.1 Theme: Myriad possible analyses
- 37.2 Advice: Avoid the paralysis of analysis
- 37.3 Theme: You don’t have to program your own analyses, but you should know how analyses work
- 37.4 Advice: If it feels wrong, it probably is
- 37.5 Advice: When in doubt, plot it out
- 37.6 Advice: Know these three formulae like the back of your hand
- 37.7 Theme: Connectivity over trials or over time
- 37.8 Theme: Most analysis parameters introduce bias
- 37.9 Theme: Write a clear Methods section so others can replicate your analyses
- 37.10 Theme: Use descriptive and appropriate analysis terms
- 37.11 Advice: Interpret null results cautiously
- 37.12 Advice: Try simulations, but also trust real data
- 37.13 Advice: Trust replications
- 37.14 Theme: Analyses are not right or wrong; they are appropriate or inappropriate
- 37.15 Advice: Hypothesis-testing is good/bad, and so is data-driven exploration
- 37.16 Advice: Find something that drives you, and study it
- 37.17 Cognitive electrophysiology: The art of finding anthills on mountains

Chapter 38: The future of cognitive electrophysiology

- 38.1 Developments in analysis methods
- 38.2 Developments in understanding the neurophysiology of EEG
- 38.3 Developments in experiment design
- 38.4 Developments in measurement technology
- 38.5 The role of the body in brain function
- 38.6 Determining causality
- 38.7 Inferring cognitive states from EEG signatures (inverse inference)
- 38.8 Tables of activation
- 38.9 Disease diagnosis and predicting treatment course and success
- 38.10 Clinical relevance is not necessary for the advancement of science
- 38.11 Replications
- 38.12 Triple-blind review for scientific publications
- 38.13 ?
